BIENNIAL REPORT

OF THE

FISH AND GAME
COMMISSION

FOR

May 1, 1942 — April 30, 1943

May 1, 1943 — April 30, 1944

PUBLISHED BY THE
MONTANA FISH AND GAME DEPARTMENT
Helena, Montana

NAEGELE PRINTING CO., HELENA, MONT.

Helena, Montana,
December 20, 1944

To His Excellency
Sam C. Ford
Governor of the State of Montana
Helena, Montana.

Dear Governor Ford:

Transmitted herewith is the Montana Fish and Game Department's Financial Report for the biennial period from May 1, 1942 to April 30, 1944.

The Commission has forged slowly, but steadily, ahead with its conservation and restoration programs. Due to the war, there has been a severe shortage of equipment and personnel. The large balance on hand is due to the accumulation of funds through curtailment of our many activities.

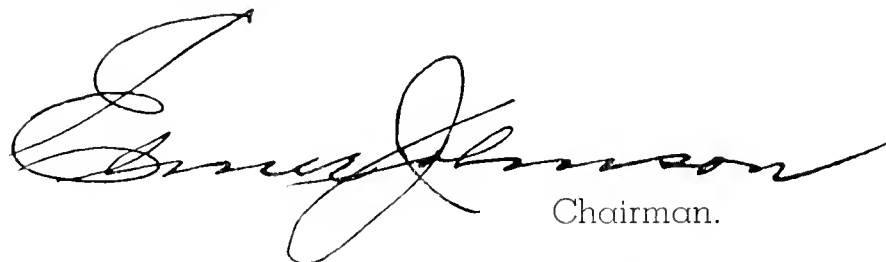

The equipment of the Department is in need of replacement and large expenditures of money will be needed when it is possible to obtain new materials.

In a recent nation-wide poll, it was estimated there will be an increase of 30 per cent in fishermen and hunters immediately following the close of hostilities. This presents all conservation departments with a grave problem and obligation. This Department will require more funds if it is to meet its obligation to sportsmen. It is felt that this revenue may be derived largely from an increase in the license fees.

The Department acknowledges, with a deep sense of gratitude, your continued interest in the welfare of Montana's wildlife resources and appreciates the support which you have given the Commission's conservation program.

Respectfully submitted,

MONTANA FISH and GAME COMMISSION

Chairman.

Secretary

State of Montana

MONTANA'S WILDLIFE RESTORATION PROGRAM

Introduction

It is interesting to note that in the past century and a half Montana has passed through a period of unbelievable abundance of game animals followed by slaughter and the resultant scarcity verging in some cases on extinction. There then followed the slow process of building back this depleted resource. We are still engaged in the latter phase of game management.

In this period of restoration a great many problems must of necessity arise regarding proper numbers of various game species to be carried on the many and diverse ranges within the scope of a state as large as ours. A great many other important industries have developed and wildlife must be placed in its proper relationship with these. Detailed investigations are of course necessary in determining this information. These are time-consuming and of necessity somewhat costly. For this reason until the inauguration of the Wildlife Restoration program, the Fish and Game Commission found it impossible, working on their limited budget, to finance this type of work to any extent. The passage by Montana's Legislature in 1941 of the Assent Act in Wildlife Restoration placed additional funds at the disposal of the Fish and Game Commission. At the beginning of the program wildlife investigations and surveys made up an important share of the work carried out. This was necessary in order that a fund of information could be quickly built up which would indicate clearly the needs for various types of wildlife development.

Big Game Investigations

In these first years of the program detailed investigations were carried on over most of the important game ranges in the state. These included the Little Belts, Crazy Mountains, Absaroka, Fish Creek-Thompson River, Gallatin, Sun River, Flathead including the South Fork, Middle Fork and North Fork, Bitterroot, Blackfoot-Clearwater, Swan Valley, Georgetown-Wise River, Madison, and the game range areas throughout eastern Montana. Within these areas the numbers of the various game species were obtained by sex and age classes and distribution. Vital winter ranges were studied in detail; snow and forage conditions were observed; conflicts, if any, with other land uses were investigated; and a detailed list of recommendations regarding the management on each area was drawn up and submitted to the Fish and Game Commission.

Game Bird Investigations

The survey work also included investigations of the game birds. The entire state was covered extensively. The range of each important species was mapped and important information concerning population densities was obtained. This information was also prepared in a concise report which was submitted to the Fish and Game Commission.

Fur Resource Investigation

Another phase of the survey work has included a study of the fur resources of the state. Through the years these have been seriously exploited and a great deal of information is now needed in order to build this important resource back to its proper place. For this purpose a

management unit was selected in northwestern Montana known as the North Fork of the Flathead area. This section was found to be typical of most of the mountainous fur-producing sections in the state in that it had been trapped so heavily in the past that a relatively small return of fur was being realized from it. This area has been closed for the last four years. It has been patrolled throughout the winters. The men engaged in this work have obtained a great deal of essential information regarding the numbers of the more valuable fur species such as the pine marten, Canadian lynx, fox, mink and beaver. Indications of such rare species as the fisher and wolverine have also been noted. The range of each of these species has been carefully mapped and analyzed, particularly in regard to the type of cover which each prefers and also its relationship to the various food species such as the snowshoe rabbit, pine squirrel, flying squirrel and others. A very encouraging increase has been noted among the valuable furbearers in this area throughout the period of closure. It is expected when the numbers reach the desired maximum that the annual increase will be carefully harvested by trappers, in this way preventing the violent fluctuation in numbers which has been so common in the past. The information obtained in this area will be as quickly as possible applied throughout the state in order that this resource may be properly developed on a statewide basis.

Trapping and Transplanting Beaver

Following the detailed survey work, and in some cases interwoven with it, has been a definite development program. This has consisted of several phases, one of which is the trapping and transplanting of desirable wildlife species, taking them from areas where they are abundant and liberating them in the sections where they are extremely scarce or in some cases absent entirely. In this way a far better distribution will eventually be obtained. Up to the present time approximately 555 beaver have been live trapped from agricultural sections where they were doing material amounts of damage and moved back into the mountains where the presence of their dams and resultant ponds will be decidedly beneficial both in checking the spring runoff and also in improving the habitat for game fish.

Trapping and Transplanting Mountain Goats

There have been 38 mountain goats moved from the Sun River area into the Crazy Mountains and Beartooth Mountains near the Cooke City-Red Lodge highway. Both of these ranges present ideal habitat for mountain goats but have been isolated from their present range by open valleys which have prevented a natural drift of this species into the areas. Very encouraging reports have been received regarding the development of mountain goats in the Crazy Mountains, where they have apparently become well established. Manpower has been lacking to carry out an intensive follow-up on the Beartooth plant; however, it is felt that these goats are undoubtedly doing quite well. The area is so immense that it will probably be desirable to make several additional plants, one perhaps in the Stillwater Canyon and one in the Boulder River drainage, in order to assure the final success of this project.

Trapping and Transplanting Mountain Sheep

Mountain sheep have been reintroduced into the Gates of the Mountains area where they were once extremely abundant but were subsequently entirely annihilated. Fourteen head have been taken from the lower Sun River Canyon and have been placed in this area. Investigations indicate that this group has drifted some little distance from the point of release but are still well within the desirable range unit.

Trapping and Transplanting Deer

Several restricted range units lying within the western portion of the state present problems of heavy winter use by deer. In some cases this use has extended even to the haystacks of the ranchers living in those areas. Therefore 199 mule deer (blacktail) were trapped in these areas and taken to desirable ranges in the eastern portion of the state. The deer that once inhabited these areas in vast abundance have been almost entirely killed out during the past several decades. The areas, however, present ideal habitat so that huntable numbers may be developed without any appreciable interference with the other land uses within these areas. Up to the present time the Bull Mountains lying between Billings and Roundup, and the badland section lying south of Glendive have been planted with deer.

It is hoped that during the coming winter this program may be expanded to include the capture of whitetail deer and their transfer into several very desirable areas where these deer were once abundant but from which they have been entirely eliminated many years ago. An area outlined for this development lies along the foothills of the Beartooth Range between Red Lodge and the Stillwater Canyon. An abundance of aspen and willow growth, coupled with a desirable pattern of coniferous species, seems to present an ideal habitat for this very desirable deer.

Trapping and Transplanting Game Birds

Among the game birds which have been trapped and transplanted have been 243 sage hens. These were trapped in Carter County in the southeastern corner of the State and released in sagebrush areas north of Helena, near Ovando, in northwestern Madison County, and in the Bitterroot Valley. All of these areas once produced an abundance of this grouse but they were completely killed out during the period of settlement. Chinese Pheasants have been trapped during the winter in areas of abundance along the Milk River and liberated in several sections where this game bird had become somewhat depleted. This wild trapped bird has been found to be extremely hardy and very adaptable. Two thousand five hundred pheasants have now been live-trapped and transplanted.

Trapping and Transplanting Pine Marten

The trapping and transplanting of marten, a phase of wildlife development that is thought to be entirely new for this country, apparently holds considerable promise as a means of re-establishing this fur-bearer throughout the desirable mountainous areas of the state. The trapping and transplanting of 12 of these animals has just been completed. These were captured in the fur management unit on the North Fork of the Flathead and liberated in the Anaconda-Pintler wilderness region.

Posting of Game Preserves

The posting of game preserves and closed areas has been carried on as a phase of the restoration program. Up to date, due to the shortage of metal, it has been difficult to obtain a sufficient amount of signs to complete this project. However, it is felt that when completed it will be extremely helpful to the sportsmen in more easily locating the closed areas in the state.

Reservoir Development

Since the inception of the program in 1941 there have been 26 reservoirs in eastern Montana upon which wildlife habitat areas have been developed. This work has consisted of fencing off portions of the shoreline of these reservoirs and planting within these areas desirable food-bearing shrubs and aquatic plants. The shrubs have consisted of Russian olive, caragana, buffalo berry, willow, poplar, rose and others, and the aquatics of sago pondweed, duck potato, bullrush, and so forth. This type of development has chiefly benefited waterfowl by the production of an abundance of food and cover for feeding, resting and nesting purposes within these desirable areas. These reservoirs vary in size from 50 to 60 acres up to several square miles.

Acquisition

The acquisition of game range either by purchase or lease represents an additional phase of the restoration work. At the present time three areas which have been found to be vital to wildlife are being purchased by the Fish and Game Commission through the use of restoration funds. One of these is known as Dry Lake and consists of approximately 1,000 acres of dry lake bed which is being once more flooded and will be planted to desirable aquatic growth and will present an ideal habitat for waterfowl. This is located in Golden Valley County a short distance north of Ryegate.

One hundred twenty-five acres of winter deer range is being purchased in the upper Judith River area west of Utica. This will round out a former purchase in that area and will present an ideal management unit for the better development of big game. The area is now being fenced and planted to desirable forage species.

Approximately 6,000 acres of key winter range is being purchased on the upper Gallatin drainage adjacent to the Yellowstone Park boundary. This unit is vital in connection with the maintenance of the Gallatin elk herd.

In these purchases all land uses have been carefully considered and all local interested groups and individuals have been consulted.

Leased Game Range

During the present fiscal year three winter game range areas in western Montana have been leased by the Fish and Game Department from the Anaconda Copper Company. One is the Fish Creek unit in Mineral County consisting of 22,000 acres of deer and elk range; another is the Thompson River unit in Sanders County consisting of 44,000 acres;

and the last is in the Blackfoot Canyon 12 miles north of Bonner and consists of a unit of 7,500 acres. These three areas are considered vital as key winter range in the development of the game herds in those particular areas. Care has been taken in working out this leasing program so that it would not interfere with other important land uses in the areas.

LAW ENFORCEMENT

During the past bi-ennium the field force of deputy game wardens has dwindled. Some of our most active young men have entered the Armed Forces, others have left the Department for higher paid occupations. It has been very difficult to replace even a few of the men with new employees who have the ability and physical fitness to efficiently do the vigorous jobs which are required of deputy game wardens.

To effectively patrol all areas where wildlife populations exist is a huge task for the number of deputies now in the field and their activity is further curtailed due to travel restrictions.

Approximately 25 per cent of our deputies in the field are past the age at which the Federal Government retires its employees in comparable positions. We have no Social Security or retirement system. Our views on retirement can be adequately expressed by quoting the following paragraph from the Report of the Commission of Inquiry on Public Service Personnel (Better Government Personnel, McGraw-Hill, New York, 1935).

“When a man has devoted his whole life to the public service, he deserves in his declining years the thoughtful consideration of the public he has served. He should not be discharged without provisions for his comfort because, though slowing down, he no longer can serve effectively at the post to which he has risen. But to keep him there because of this feeling of public indebtedness is neither a kindness to him nor a good thing for the service. To be efficient and adaptable the public service must be a young and vigorous organization. It must not permit the channels of advancement to become clogged with super-annuated employees.”

It is the aim of the State Fish and Game Commission, through its associated personnel, to protect and propagate the worthwhile things that every sportsman looks upon as his priceless heritage and our efforts are devoted to this purpose.

F I S H E R I E S

The past biennium has been an extremely difficult one for the Fisheries Division. Not only has it been almost impossible to keep our hatcheries full-manned, but the limited personnel we were able to secure was inexperienced. Due to the low wage scales prevailing during these times in comparison with other industries and fields of endeavor, individuals accepting employment have usually only done so until a more lucrative job could be obtained and very often their term of employment would not exceed one to six months.

The mechanical equipment and other physical apparatus of our hatcheries have likewise been put to a severe test and especially the distribution units and trucks used for planting fish from the hatcheries to the many streams and lakes over the State. Our previous policies were to exchange these units practically every year for new equipment and this year practically all of these units have entered their third year of service and the maintenance problem has become quite critical.

However, in spite of these and many other handicaps all hatcheries within the State have operated to full capacity. This has been made possible only by the splendid cooperation and untiring efforts of the experienced personnel who have been left in charge. They have in many cases disregarded all holidays and worked long hours to insure the successful operation of their plants. Several of our neighboring states have been compelled to suspend operations as much as 60 per cent and we feel that this splendid record of continued operations could not have been made possible without the loyal support of every hatchery man.

Development work has also been carried out on the Marlowe and Arlee Ponds near Arlee, Montana, and these units will be in full production this coming season.

The warm water fisheries program has made splendid progress. Much of the stock for transplanting has been acquired through rescue operations from various remote reservoirs where an overstocked condition existed. This year the Miles City Pond Culture Station which is operated by the Fish and Wildlife Service in cooperation with the State Fish and Game Department, produced a larger number of Bass, Crappies, Bream and Bullheads than at any previous time and the cooperative efforts of both agencies have been responsible for the stocking of over 200 reservoirs and lakes in the Eastern part of Montana in addition to the restocking of many bodies of water where fishing pressures have seriously depleted the species formerly predominating. However, to bring the warm water fisheries program to a more efficient plane much additional equipment is required such as specially designed distribution trucks, nets, traps, seines and experienced personnel to operate. This, of course, is impossible to obtain at this time but should be acquired just as soon as such equipment is released.

It is sincerely hoped that with the cessation of hostilities in Europe

much badly needed equipment will be readily available so that the Fisheries Program can be expanded to meet the increased fishing pressures that are bound to arise in the near future.

At the present time 12 State hatcheries are in operation and these, in addition to the three Fish and Wildlife Service hatcheries also operating within this State, have combined output of approximately 20,000,000 trout of various sizes and have the responsibility of maintaining adequate fishing in over 25,000 miles of streams and rivers and 1,500 lakes. This is indeed a heavy burden to place upon such few hatcheries, especially when we consider that a number of the plants are of relatively small size and limited water supplies and lacking the facilities for rearing pond expansion which is necessary if we hope to produce larger numbers of 5 to 7-inch trout which will be absolutely necessary to maintain satisfactory fishing conditions when travel restrictions are lifted.

It would be our recommendation that additional sites and facilities be acquired and an expansion program developed which would result in increasing the output of 5 to 7-inch fish at least 100 per cent and if possible, even greater. However, without the facilities and the funds to inaugurate an expanded program of the proportions mentioned above, it will undoubtedly be necessary to institute restricted fisheries management policies such as shortened seasons and reduced creel limits if satisfactory fish populations are to be maintained.
